Uterine Fibroid Embolization (UFE)

Nonsurgical procedure to block blood flow to fibroids,
causing fibroids to shrink and die

Minimally invasive, performed through
a pin-sized hole in the wrist

In-office procedure

No general Anesthesia required

Preserves uterus

Average 1-week recovery

Minor side effects. Can include
mild nausea and cramping but some
women have none.

VS

Abdominal Hysterectomy

Surgical removal of the uterus

Can be highly invasive
with one or several scars depending
on how it is performed

Requires hospital stay

General Anesthesia

Removes uterus

Average 2-to-6-week recovery

Major side effects. Severe pain
with prolonged recovery time.
